Wire is sized by the American Wire Gauge (AWG) system. Wire gauge refers the physical size of the wire, rated with a numerical designation that runs opposite to the diameter of the conductors—in other words, the smaller the wire gauge number, the larger the wire diameter. Common sizes include 14-, 12-, 10-, 8-, 6-, and 2-gauge wire.

Matching Wire Size to Circuit Amperage

Using a wiring diagram, identify the 5V, ground and signal wires. Place the meter leads between the 5V and ground terminals coming from the computer, not the sensor. You should see very close to 5Volts. If it does go to step 8. If the meter reads other than 5 volts, ground one meter lead and test the 5 volt reference wire. It should read 5 volts.

Disconnect the connector from the sensor. Check the wiring at the base of the connector this is a popular place for the wiring to break. Look for broken or loose wiring insulation or damaged pins as well. Step 2: Check System Reference Voltage. Most sensors in a computer system run off of reference voltage, from 5 to 12 volts in most cases.
