It is estimated that Pascal will achieve 100,000 transactions per second as a theoretical limit (assuming a block size of 5.6 GB) with extensive core factoring, optimizations, and hardware configurations. Pascal's total throughput is essentially only limited by Moore's Law, storage space, and a highly decentralized architecture.

History. The earliest known mention of the gambler's ruin problem is a letter from Blaise Pascal to Pierre Fermat in 1656 (two years after the more famous correspondence on the problem of points). Pascal's version was summarized in a 1656 letter from Pierre de Carcavi to Huygens: . Let two men play with three dice, the first player scoring a point whenever 11 is thrown, and the second whenever ...

This law came from a manipulation of the Ideal Gas Law. $\left[P \propto \frac{1}{V} \right]$ or expressed from two pressure/volume points: $\left[P_1V_1=P_2V_2 \right]$ This equation would be ideal when working with problem asking for the initial or final value of pressure or volume of a certain gas when one of the two factor is missing.

History. Johann Bernoulli posed the problem of the brachistochrone to the readers of Acta Eruditorum in June, 1696. He said: I, Johann Bernoulli, address the most brilliant mathematicians in the world. Nothing is more attractive to intelligent people than an honest, challenging problem, whose possible solution will bestow fame and remain as a lasting monument.

The problem goes back to a Hungarian Mathematical competition problem of 1928 (see references). On another page we look at the Lucas numbers $Lucas(n) = Fib(n-1) + Fib(n+1)$ and find that $Lucas(i)$ is $Round(\Phi^i)$ so the initial-digits-of-powers applies to the Lucas numbers also.

Strategy and Solution for (d) The easiest way to calculate power in watts (W) dissipated by a resistor in a DC circuit is to use Joule's law, $P = IV$, where P is electric power. In this case, each resistor has the same full current flowing through it.

Occam's razor (or Ockham's razor) is a principle from philosophy. Suppose there exist two explanations for an occurrence. In this case the one that requires the smallest number of assumptions is usually correct. Another way of saying it is that the more assumptions you have to make, the more unlikely an explanation. Occam's razor applies especially in the philosophy of science, but also more ...
