Temporomandibular disorder (TMD) is an umbrella term that encompasses several clinical entities that affect the temporomandibular joint (TMJ) or extraarticular structures, as described by the expanded taxonomy for TMDs, which was developed by the American Academy of Orofacial Pain (AAOP) in 2014 . It is the second most common chronic musculoskeletal condition after chronic low back pain.

To evaluate the use of coronal magnetic resonance (MR) imaging in assessment of disk position in the temporomandibular joint (TMJ), sagittal and coronal 1.5-T MR images were obtained of 158 TMJs in 79 patients. From the sagittal images, medial or lateral displacement was suspected in 24 joints.

The referral will usually describe the clinical presentation and indicate whether the aetiology is likely to be muscular or joint in origin. Imaging is rarely indicated for masticatory myalgia unless there is a history of a precipitating event, such as dental treatment or trauma, or if there are other symptoms and signs, such as trismus, swelling or fever ().

Purpose: The aim of this study was to evaluate the relations of the condyle excursion angle (CEA) and the morphology and morphometry of the articular eminence to disc displacement (DD) using magnetic resonance imaging (MRI) of symptomatic patients. Materials and methods: MRIs of 199 temporomandibular joints (TMJs) were evaluated. . Qualitative and quantitative morphologic analyses were ...

The temporomandibular joints are the two joints connecting the jawbone to the skull. It is a bilateral synovial articulation between the temporal bone of the skull above and the mandible below; it is from these bones that its name is derived. This joint is unique in that it is a bilateral joint that functions as one unit. Since the TMJ is connected to the mandible, the right and left joints must function together and therefore are not independent of each other.

Robert J. Hinton, ... Jian Q. Feng, in Current Topics in Developmental Biology, 2015. Abstract. The temporomandibular joint (TMJ) is a small synovial joint at which the mandible articulates with the skull during movements involved in speaking and mastication. However, the secondary cartilage lining its joint surfaces is indicative of a very different developmental history than limb cartilages.
